GEONOVUM

Geonovum is the executive committee of the National Spatial Data Infrastructure in the Netherlands.

GEO NOVUM

Let the government perform
better with geo-information.
That is where we work on
every day.

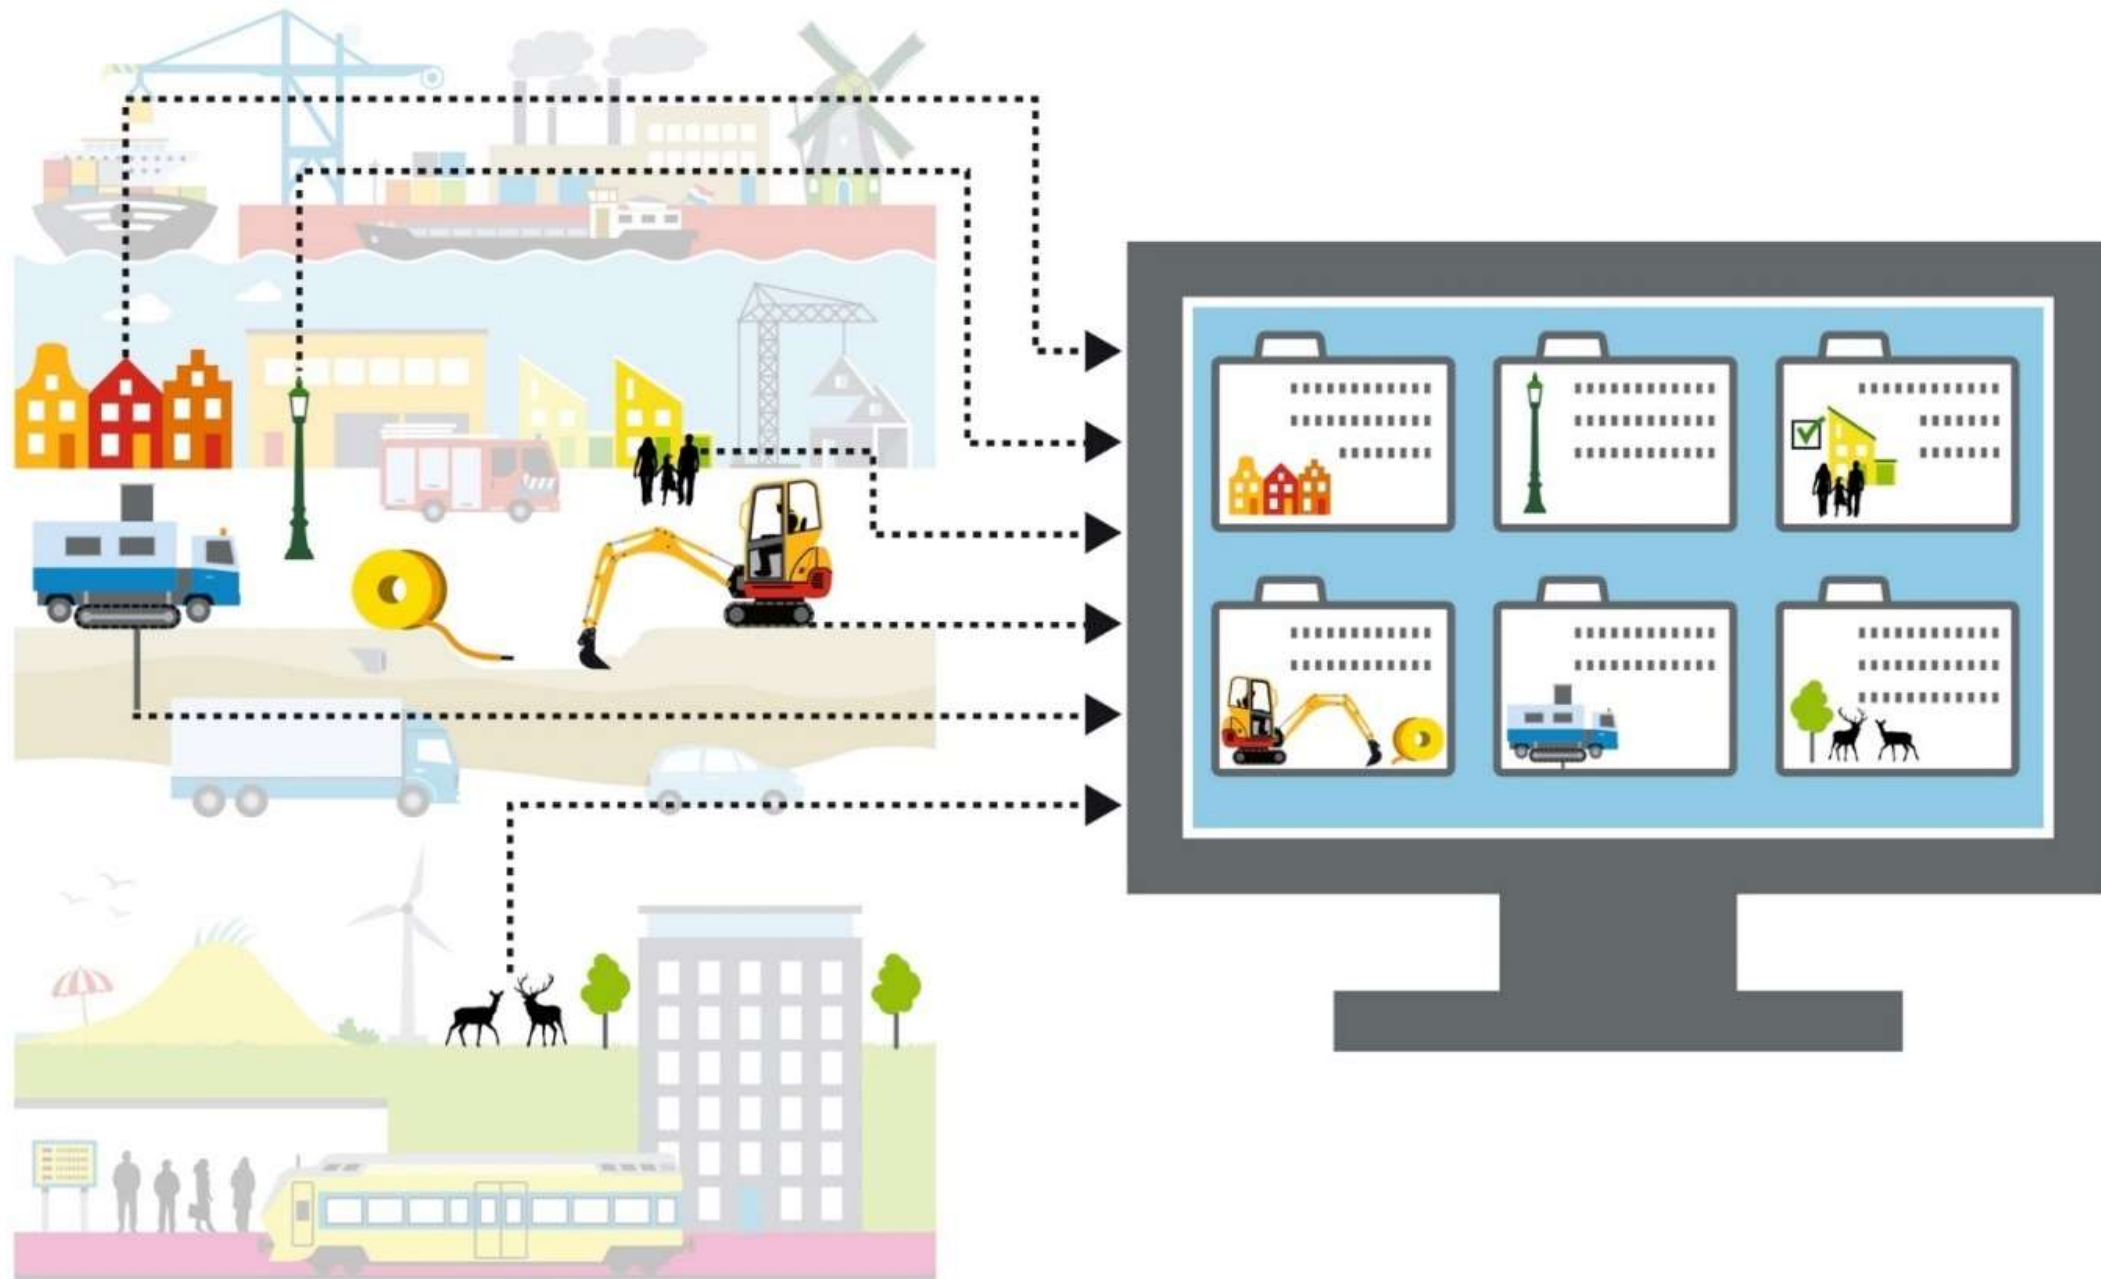

Geonovum explores, enables and ensures

Our tasks focus on
developing and managing
standards, ensuring that
spatial data is accessible,
interoperable and can
easily be found and used.

The Spatial Enabled Society

The connecting force of standardization

We enable collaboration within sectors by developing and maintaining standards.

We do this in an open developing environment where both public and private sector parties work side-by-side.

By developing validation tools and instructions we furthermore enable data and service providers to meet the requirements of standards.

Standardization

Geonovum manages the geo-standards that are necessary for the geo-information infrastructure to work.

For this we work together and actively participate in various international standardization organizations.

- ISO / TC 211 and
- Open Geospatial Consortium (OGC)
- World Wide Web Consortium (W3C)
- INSPIRE
- we follow the developments at OMG and OASIS, which deal with standards for IT

This often involves coordinating domain-specific standards and coordination between geo standards and the i-government.

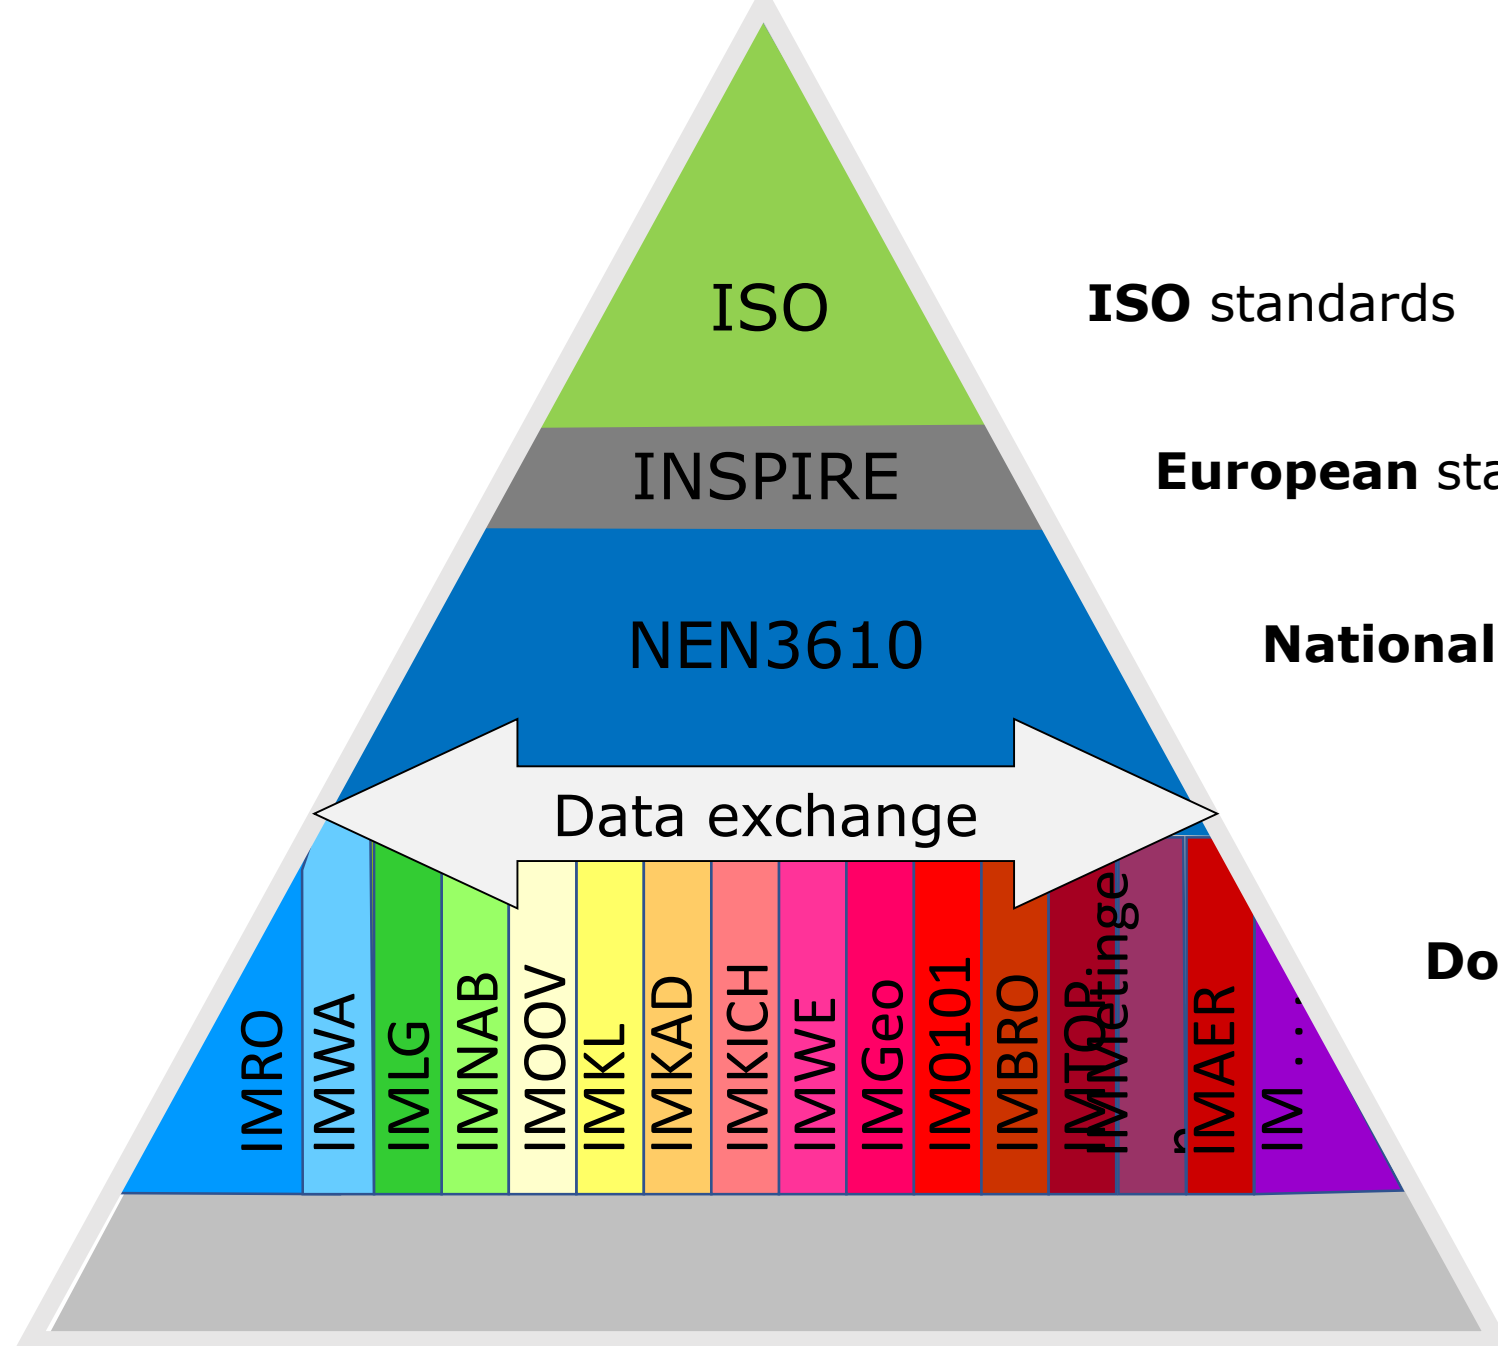

Geonovum ensures that new and changed international geo standards, if relevant and supported by the Netherlands, are adopted and recognized in the Netherlands.

StUF-Geo BAG

Workshop 'The future of INSPIRE'

2018 INSPIRE Conference in Antwerp Geonovum organised a workshop on the future of INSPIRE. Around 70 people from a great variety of European member states (from coordinating bodies, data providers and implementors) and European institutions like the Commission and JRC participated.

Outcomes of this workshop are available in english

NL INSPIRE vision

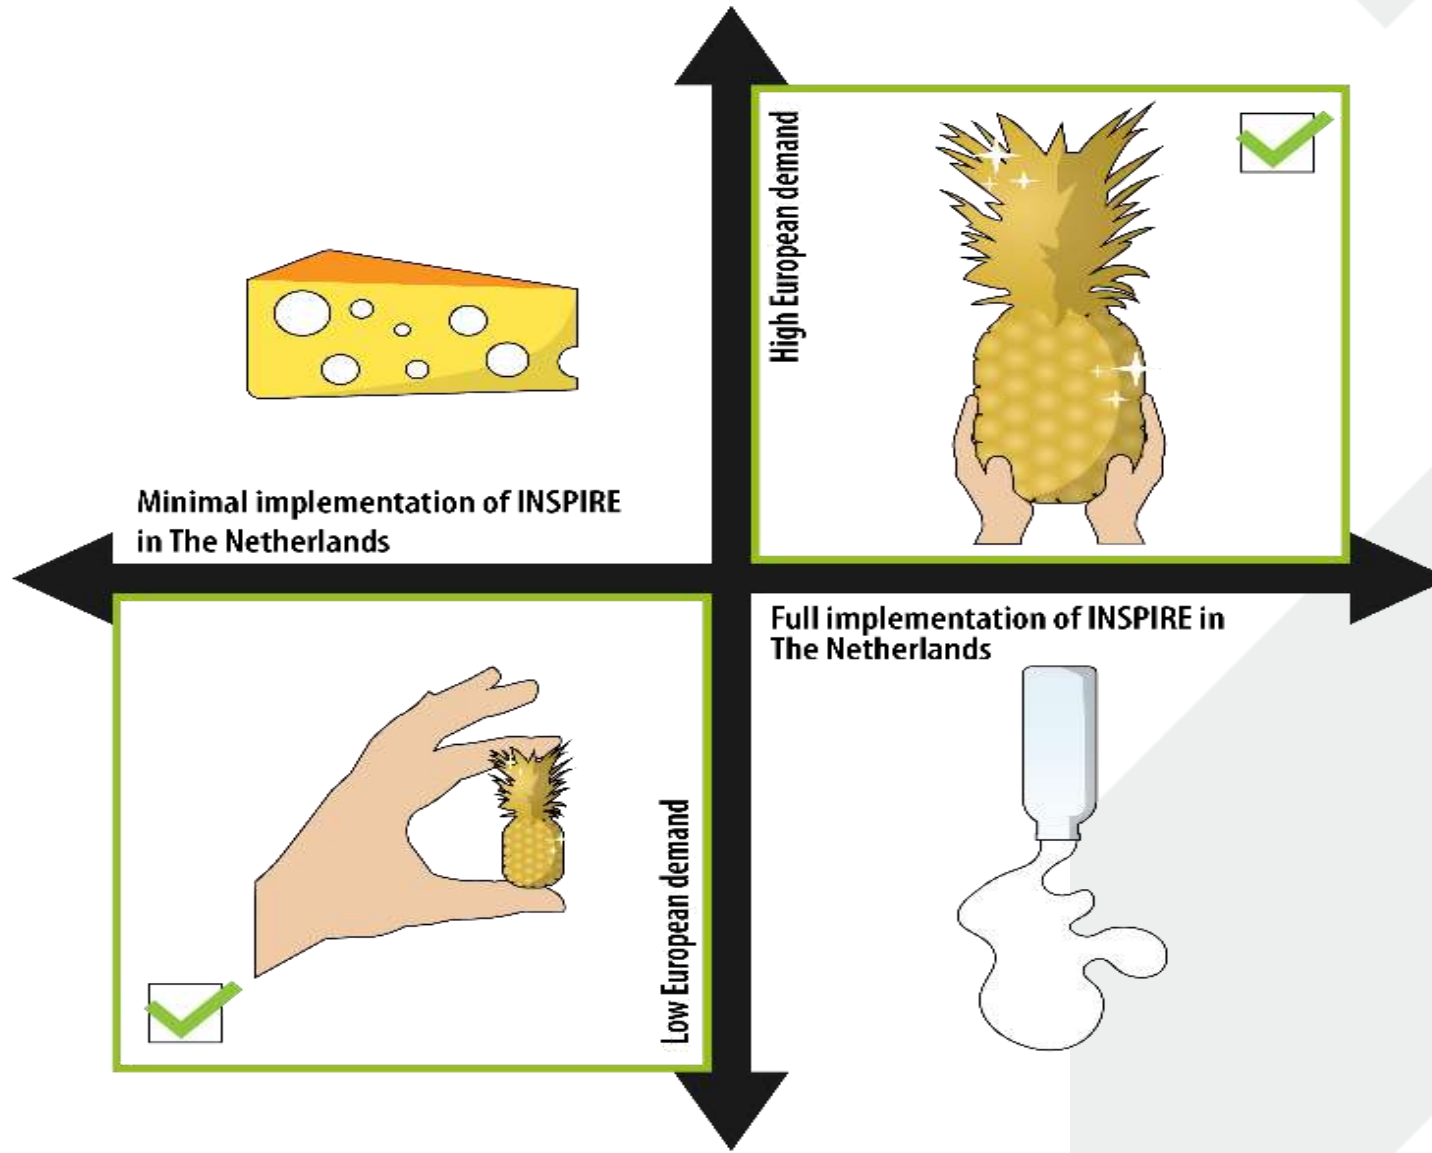

The future of INSPIRE: from supply to demand?

From steering the implementation...

to managing the benefits

NL INSPIRE vision

The upper left quadrant contains a cheese with holes. The (minimal) implementation is insufficient to respond to the demand. The consequence is that the benefits of INSPIRE are not cashed in, but the costs are low.

In the upper right scenario we find the **golden pineapple**: demand and supply connect with each other, benefits are redeemed, costs are (relatively) high.

At the bottom right we see spilt milk: there's optimal implementation but demand doesn't take off, creating over-supply and high costs.

on the lower left we have the **better one pineapple in the hand**... scenario: both demand and implementation are minimal, costs and benefits are low.

The quadrants are not so much a choice, but illustrate, from the point of view of efficiency, that we must strive to make supply and demand more compatible. This means, among other things, that we must look at which scenario is most desirable for each theme

NL INSPIRE vision, benefit management

An important means to find a good balance between demand and supply is benefit management.

In the case of INSPIRE, we find the benefits in particular at European level. This means that good interaction between the European and national levels is essential.

An example of this is the use of INSPIRE for reporting on environmental directives. The benefits are not only for the European Environment Agency (better European environmental policy), but also for the member states (no double reporting streams and therefore a reduction in the burden).

However, realising these benefits does not happen by itself and will only succeed if all parties involved

NL INSPIRE vision, conclusions

The philosophy of sharing European information so this information can be used quickly and relatively easily in policy, is seen as valuable by most parties.

The broad support for this within Europe and Member States is unique, as is the European and national organisation of INSPIRE.

There is a functioning and extensive network in place with enough energy to achieve common objectives.

This organisation becomes stronger by the legal basis, which makes INSPIRE a very strong instrument for unlocking European data.

In recent years, INSPIRE has therefore had , positive effects on the development of a Dutch and European SDI.

NL INSPIRE vision, conclusions 2

At the same time we have to conclude that it has not been enough for the actual purposes of INSPIRE. Using data for European environmental policy is still very limited.

The main reason for this is that supply does not yet totally fit demand. This applies not just to the supply of data but also to the way it is supplied.

Now that demand for European data is growing in more and more areas, the challenge is to prioritise a correct and rapid response to that demand.

This means requirements for;

- the organisation (involving the demand),
- the data (new sets of information) and
- the technique (new techniques for unlocking the data).

The steering has so far focused mainly on the technical implementation of INSPIRE and not on the realisation of the benefits.

The Commissions' steps towards working with priority datasets and exploring the possibilities in other policy areas are good developments and seem to indicate a move in a direction in which the European demand will become more central

Linda van den Brink, [Geonovum](#)

Payam Barnaghi, [University of Surrey](#)

Best Practices Summary

Web principles

Best Practice 1: Use globally unique persistent HTTP URIs for Spatial Things

Best Practice 2: Make your spatial data indexable by search engines

Best Practice 3: Link resources together to create the Web of data

Spatial aspects

Best Practice 4: Use spatial data encodings that match your target audience

Best Practice 5: Provide geometries on the Web in a usable way

Best Practice 6: Provide geometries at the right level of accuracy, precision, and size

Best Practice 7: Choose coordinate reference systems to suit your user's applications

Best Practice 8: State how coordinate values are encoded

Best Practice 9: Describe relative positioning

Best Practice 10: Use appropriate relation types to link Spatial Things

Best Practice 11: Provide information on the changing nature of spatial things

Best Practice 12: Expose spatial data through 'convenience APIs'

Best Practice 13: Include spatial metadata in dataset metadata

Best Practice 14: Describe the positional accuracy of spatial data

★ ★ ★ ★ ★ Linked RDF
IS YOUR DATA 5 ★ ?

Web Principles!

WEB ARCHITECTURE

- ★ **Linkable:** use stable and discoverable global identifiers
- ★ ★ **Parseable:** use standardized data metamodels (e.g. [CSV](#), [XML](#), [RDF](#), or [JSON](#)).
- ★ ★ ★ **Understandable:** use well-known or at least well-documented vocabularies/schemas
- ★ ★ ★ ★ **Linked:** link to other resources whenever possible
- ★ ★ ★ ★ ★ **Usable:** label your document with a license

The future

We contribute the knowledge and experience we gain in the Netherlands to the working groups of the international standardization organizations;

- the Open Geospatial Consortium (OGC) and
- the World Wide Web Consortium (W3C)

Major success factors

- Knowledge
- Network
- Neutrality

Work on all aspects of interoperability;

explore, enable and ensure

focus on developing and managing standards, ensuring that spatial data is accessible, interoperable and can easily be found and used.
